Project Management Software Recap

Project Management Software recap

Project Management Software is designed to streamline project tasks, enhance team collaboration, and ensure timely delivery of projects. These solutions offer comprehensive tools for planning, scheduling, resource allocation, and progress tracking. By centralizing project data, they help you optimize workflows and minimize inefficiencies.

\n\n

Project Management Software solutions are developed to help you and your organization efficiently manage projects from inception to completion. These products provide functionalities for task assignment, timeline visualization, budgeting, and performance monitoring. They offer platforms where teams can collaborate in real-time, ensuring transparency and accountability. Key features often include Gantt charts, Kanban boards, resource management, and integration with other enterprise tools.

\n\n

Common Use Cases\n

The most common use cases for Project Management Software include project planning and scheduling, resource allocation, and task management. You can also use these solutions for time tracking, budgeting, and milestone setting. Additionally, they serve as platforms for team collaboration, allowing you to manage communications, share documents, and resolve issues promptly.

\n\n

Most Valuable Features\n

The most valuable features you will find in Project Management Software include Gantt charts for timeline visualization, Kanban boards for task management, and time-tracking tools. Resource management capabilities help you allocate and optimize human and material resources. Integration with other software, such as CRM and ERP systems, is also pivotal for seamless operations. Reporting and analytics tools are essential for monitoring progress and performance.

\n\n

What's Trending?\n

Trends in Project Management Software encompass AI-driven analytics for predictive project outcomes, enhanced integration capabilities with other enterprise software, and mobile accessibility for managing projects on the go. There is a growing focus on user-friendly

interfaces and customizability to cater to varied industry needs. Cloud-based solutions are becoming standard, offering greater flexibility and scalability.

\n\n

In summary, Project Management Software is vital for enhancing project efficiency and effectiveness. These solutions provide robust tools for planning, tracking, and managing resources and tasks. By facilitating real-time collaboration and offering valuable reporting insights, they empower you to achieve project goals more efficiently. These evolving tools are essential for modern, complex project environments.

Executive summary

Monday.com is a project management solution used for CRM, task tracking, managing projects across multiple disciplines, and maintaining continuity of service for clients and team members. Its most valuable features include global search, scalability, stability, flexibility, affordability, user-friendliness, and task management features. The solution is also praised for its ease of use, adaptability, and automation capabilities. Monday.com has improved efficiency, provided automatic reminders and dashboards for executives, allowed for better collaboration, and reduced paper usage. It has helped organizations to be more organized and improve communication.

monday.com is a basic yet intuitive work operating system that facilitates teamwork in these ways:

- Allows teams to define workflows
- Adapts to changing demands
- Establishes transparency
- Allows for collaboration
- Eliminates manual grunt work

monday.com is extremely adaptable and may be utilized in any sector and for any workflow. You can build your apps to match your specific operational needs and modify your boards, dashboards, and documents to fit your team properly. It may be used for anything, including projects and procedures, and it can be used across teams, departments, leaders, and organizations.

Here are a few examples of how monday.com software can be put to good use:

Marketing pipelines

Recruitment procedures

Video production planning

Tracking progress

Product timelines

Business management

Design planning

Bug tracking

Event planning

Construction planning

monday.com Features

monday.com has many valuable features. Some of the most useful ones include:

- Customized workflows
- Task prioritizing
- File sharing
- Drag-and-drop
- Context-aware communication
- Progress and milestone monitoring

The most popular key features include:

Work scheduling: monday.com's Workload feature allows you to accurately assign and schedule team members at any given time. Check who's available and who isn't so you may reschedule or reassign work as needed to meet all of your project deadlines.

Tracking time for tasks: It's crucial to know where your time goes, especially if you're invoicing clients by the hour. Greater work precision is achieved by having a clear grasp of how much time is spent on each task because you're able to make more informed decisions about how you spend your time.

Automated processes: Automations eliminate the need for manual labor in the completion of repetitive tasks.

At-a-glance dashboards: Dashboards are an excellent method to quickly see what's essential. They make it simple to gather useful information, manage project progress, predict effort, and keep track of budgets. They also keep your team focused and engaged on the high-level objectives that drive progress.

Integration with external tools: With two-click integrations, you can easily make monday.com your primary work hub. Integrate popular external apps like Jira and Slack, as well as Gmail and Mailchimp, to optimize your workflow even further.

Varied options for viewing data with Views: monday.com provides a number of ways to examine the data in your boards, including Gantt Chart View for project plans and Chart View for progress tracking. Views helps you to take a fresh perspective on things and obtain crucial insights that you might not have gotten otherwise.

Reviews from Real Users

monday.com stands out among its competitors for a number of reasons. Two major ones are its task status feature and its ability to integrate with external apps. PeerSpot users take note of the advantages of these features in their reviews:

Ben D., Front End Developer at a marketing services firm, writes of the product, “Their flagship feature, what used to be called the pulse, is great. Pulse offers great management.

[Being able to see everything at a glance and check task status, is wonderful.](#)

They use subtasks and the simple aspects of task management have been really helpful.”

Another PeerSpot reviewer, the Head of Projects at Smart Media SA, notes, “The boards offer an amazing and clear view of my tasks, campaigns, and progress. [Automations especially with Slack and Outlook help with keeping my team up-to-date always.](#) Graphs and charts are valuable for reporting purposes and to track progress made. Workforms/surveys are valuable and a very cool added feature.”

What users had to say about valuable features:

“The tool's most valuable feature is its intuitive interface, which allows project managers to create comprehensive project roadmaps. This interface lets us list tasks and allocate them to team members, tracking who works on which task and when. We utilize it for project management from the initial phase.

The solution is flexible. The grid-based interface allows for customization, so I can focus only on what's relevant. This flexibility and dynamic sorting among the columns are strong features. Another valuable aspect is the board feature, which allows for much customization. You can organize your work, weeks, or schedule according to your preferences.

monday.com's dashboard feature helps boost my team's productivity. I've found the Azure DevOps integration to be the most beneficial. I believe there are third-party extensions available on the marketplace that fill the integration gap. It seems that monday.com is working with vendors in the market to make more of these integrations available.

It's a great tool. It allows me to manage many things in one place, both my tasks and day-to-day interactions within the team. I think the whole team resonates with it. ”

I don't really use the tool's advanced features, but I think it is quite convenient that I can just link the remaining timeline to calculate the set of end dates and the start dates. The tool can also auto-calculate the remaining days, and I can also figure out whether it is overdue or is still within the timeline that I had set, making things quite convenient for me.

“The most valuable features of monday.com for our organization are undoubtedly the dashboards, checklists, calendar functionalities, and file-sharing capabilities. Dashboards serve as a visual command center, offering a comprehensive overview of project progress, deadlines, and key performance indicators. This visual representation enhances decision-making and facilitates a quick understanding of the project landscape.

Checklists play a pivotal role in task management, allowing for a structured approach to project execution. The ability to create, edit, and update checklists within the platform ensures that team members stay organized, tasks are completed in a systematic manner, and project timelines are adhered to.”

Though the product's interface is quite simple, it lacks some functionalities. There are some automation areas that work quite well in the solution, but the product lacks in certain items when it comes to implementation.

“We thoroughly enjoyed the automation to help us see where our cases are going next. The entire visual aspect of Monday is also a great resource for our firm as it makes it easy for us to point out certain things and for our management meetings to go smoothly.

The ability to track dates and times we need cases to be completed has been of great use to my firm. Our attorneys are able to monitor and track our cases with ease every day as they please. It has greatly improved how we track out cases and hit our deadlines. ”

“I like the automation you can do with monday.com. You can automate priorities, status changes, notifications, etc. You may need another solution to create this automation in other tools, but monday.com includes everything. The Gantt view for project planning is also pretty good.

The interface is another area where monday.com shines. It is colorful and visually appealing. You can paint with colors, and there are multiple views. If you are the type of person who wants all of your information displayed linearly, you can set it up in lines.

It's the best tool for evaluating timelines and projects. The most challenging part is deciding how you want to display your information, but as soon as you know what you're doing, it's effortless to view where you are in the project and who's involved.

You can set up a simple project in under five minutes, but a super complex one might take a few days. I think it's straightforward if you know how you want to organize your information.

monday.com is accessible to non-technical users but takes a lot of time. They have many tutorials, and you can easily use monday.com if you can take the time to go through them and learn. When you initially create a project, it's only a board with lines on which you enter the tasks. You have some columns with the task owner, status, deadlines, etc. It is not that easy to understand all the features and how you can use them for your case, which is why people contact me.

When you implement the tool, you decide which layout to use and what information you want to disclose. I've seen clients who have been using this for three years, and they still only know how to do things one way because they haven't taken the time to understand all the features. It's crucial to spend time at the start and learn the tool. I don't think the learning curve is that huge. ”

Pain Points

The main pain points mentioned:

- ✘ “I believe the reporting functionality could be improved on monday.com. While some reports are accessible, this area has room for enhancement. For example, including a Gantt chart in project planning would be valuable. This addition could make monday.com more competitive with tools like Microsoft Project. Overall, I think there's potential for improvement in the graphical interfaces and reports provided by monday.com.”

Usman ur Rehman Ahmed

- ✘ “If I want to use the product after I have completed my assignment, or if I want to use it for some of my other projects, I don't really get to use it again.”

- ✘ “It would be beneficial to consider incorporating features that enhance the platform's customization capabilities in the next release.”

The product fails to provide a free version for a long period of time. From an improvement perspective, the tool should provide its free version for a longer time. If I want to use the product after I have completed my assignment, or if I want to use it for some of my other projects, I don't really get to use it again.”

“While monday.com has been an invaluable tool for our organization, there are areas where improvements could enhance user experience. Specifically, expanding pulses could be more user-friendly. Currently, users need to click on a small text line to expand pulses, which can be somewhat cumbersome. A more intuitive approach would be to enable users to click on the entire table cell for pulse expansion. This modification would streamline the process, making it more accessible and reducing the risk of oversight.

Additionally, it would be beneficial to consider incorporating features that enhance the platform's customization capabilities in the next release. Providing users with more options to tailor their boards, dashboards, and views would contribute to a more personalized and adaptable user experience. This could include advanced formatting options, customizable templates, or the ability to incorporate additional data visualization tools.”

“Having more integrations for different specialties that use Monday would be great. Monday is awesome as it is, however, expanding would also be helpful.

Monday should have people reach out to different heads of businesses in different sectors to see how they use Monday and create more templates and maybe even videos on how they use it so there are more ways for people who are just starting out to find more examples to see how to tailor Monday to their needs.

I met up with a specific immigration attorney who helps immigration firms organize and pull their business to more paperless solutions she introduced us to Monday and showed us how she uses it and we tailored it for our needs. ”

“monday.com is missing a few features but not many. For example, let's say you're working on a global project for a marketing campaign, and you have the video team working on it. Maybe the video team only wants a board that shows the packages that are related to them, but you cannot do that on monday.com. You can't have the same task in multiple projects. ”

Tracking timeline, resource allocation, and monitoring are areas of concern for the tool where improvements are required. Improvement in tracking timelines, resource allocation, and monitoring can help our company check whether each and every activity related to a project is completed or not. Executive summary

Asana is web-based software-as-a-service that helps teams coordinate and manage their work. It helps companies move faster by making sure everyone knows the team's plan and process and who is doing what by when.

Each user can create projects using a list, board, calendar, or timeline view. Within each project, users can add tasks, subtasks, sections, comments, attachments, start and due dates, and custom fields. Project and task followers get notifications on changes or comments on the project and/or task in their Inbox. Individual users can see all of the tasks they're responsible for across all of their projects in a view called My Tasks.

Asana is available in English, French, Spanish, German, and Portuguese.

Asana is a very simple interface for project managers to figure out, providing all the functions they need. Asana is one interface that contains multiple functions such as object key results (OKRs), time plans, metrics, and risk management. All these functions can help you to easily implement your project from the initiation to the evaluation stage.

When you have access to Asana as a project manager, you will find everything you want inside it. In some cases, if we use alternatives, we have to jump from one program to another and some apps to complete everything. However, Asana is an interface that includes everything you want.

The main pain points mentioned:

✘ “More features can be added.”

Room for improvement:

Asana should provide the ability to have read-only users. Sometimes, I need to collaborate with people external to my organization, and I would love to invite them to my Asana board and assign tasks to them. Sometimes, these are short collaborations. I work in marketing, and sometimes I work with agencies.

I would love to do project management on my side, which would be way easier. It's difficult to have short-term collaborations with external users because the operations team owns the final licenses, and I work for marketing.

“It would be great if Asana could create a library for each project within the interface. For example, if you are working on ten projects and need to make daily changes to all of them, having a separate library for each project would be helpful.”

There is always a constant need to update the product to be able to give it more features in terms of tasks like adding commands or nodes. The product's page is not user-friendly. In general, the product's page should be more friendly to use. Asana does have all the things the user requires, making it a good product.

The mobile application of Asana has to be improved a lot because no one wants to do a complete project management task on mobile. While on my mobile phone, I would like to get an update quickly or a short task notification so that I don't forget anything, for which the mobile interface is very clumsy.

I don't have anything related to the additional features required in the solution on top of my mind because my company hasn't even used 50 percent of the tool's feature set. We have customized the tool based on our processes. We are using whatever we need in the tool, so I don't have any suggestions for adding features to Asana.

The calendar view in Asana has shortcomings and can be improved. The other element is the ability to natively be able to add additional connectors to better manage the planned time versus the actual time for each task.

The timesheet aspect is an additional feature I like to see in Asana since we now use another application called Toggl for managing our time cards. It would be better if we could do what we do in Toggl directly in Asana since it would be easy to plan activities.

“Some customizations and functions are still not available, however, so far, they haven't been a deal killer. Asana appears to be open to suggestions, and as they are continually making improvements, these might be implemented in the future.

It takes some time to get used to and is initially difficult to navigate Asana. It gets much better as you get to know about Asana. Since you can't set up an advanced search to distinguish between tasks, folders, and projects, I also have trouble with the search feature.”

Jira

Executive summary

Jira is a powerful cloud- and subscription-based application lifecycle and issue management solution. It is designed to aid users both in project management and in resolving any issues that arise at any point in the software development process. It is especially concerned with easing the ability of developers to collaborate.

Jira Benefits

Some of the ways that organizations can benefit by choosing to deploy Jira include:

- **DevOps lifecycle visibility and planning.** Jira provides application developers with tools that enable them to track and visualize where they are in the development process. This means that a DevOps team can measure their progress at all times. Jira's roadmapping feature also enables a DevOps team to work more efficiently by setting goals for their projects, keeping them on track. Additionally, they are able to track whether they are meeting the goals that they set for their projects.
- **Regular product updates.** Atlassian is constantly updating Jira so that it is continuously evolving into an ever more powerful and user-friendly solution. Users can be sure that the product that they are using is always being tweaked so as to provide them with the best possible project management solution.
- **Flexibility.** Jira enables users to customize their workflows and dashboard so that the solution is operating in a way that best matches their needs. Jira can also integrate with more than 3,000 other applications and integrations. Organizations can use it to expand their project management and DevOps capabilities in many different ways.

Jira Features

- **Security capabilities.** Jira is equipped with a number of useful security features. It gives administrators the ability to restrict access to certain tools so that only users who are authorized to complete certain tasks have access to the tools related to the completion of that task. Users can also set default permissions so that only particular users can work on new projects or particular projects.

Real-time notification feature. Users can set Jira so that it offers them notifications that contain critical information in real time. It can send users email notifications when pressing issues have been updated. They can also set it to notify them about tasks that may be due, or other similar events.

Activity log. Jira has the ability to track any and all changes that are taking place within the software framework. Users can keep a close eye on everything that is going on. This promotes a high level of visibility and can be leveraged to aid developers in their collaboration efforts.

Reviews from Real Users

Jira is a powerful solution that stands out when compared to many of its competitors. Two major advantages it offers are its workflow engine and its highly customizable dashboard.

Bharath R., the tool implementation and project management lead at a financial services firm, writes, “I feel the strongest feature of Jira is its [workflow engine](#). It empowers us to automate our workflows within our organization. It's the one characteristic of Jira which I think can help any organization, be it in any domain.”

Uday J., a staff engineer at a computer company, says, “Another thing that I like a lot about Jira is that in the [dashboard](#), you can plug the modules that you want. You can enable certain sections. For example, you can show trend history, open Jira tickets, etc. Some of the managers have created a dashboard for each engineer.”

“What I really like about Jira is that it ticks off all the boxes for any agile project. It's easy to set up, easy to use, and it has excellent notification features. Jira is the top choice for anyone working on agile projects like ours.”

Allan Skeels

“Jira improved our team collaboration by providing visual visibility and transparency. Everyone could see what tasks were being worked on and the progress made. The development team updated task statuses, making tracking progress and planning sprints easy. If there were any impediments or challenges, we addressed them. This process helped us track our progress.”

“Jira improved our team collaboration by providing visual visibility and transparency. Everyone could see what tasks were being worked on and the progress made. The development team updated task statuses, making tracking progress and planning sprints easy. If there were any impediments or challenges, we addressed them. This process helped us track our progress.

What I find most valuable in Jira is overall architecture, especially the ability to create dashboards. This feature allows me to gain insights into my projects.

Jira's reporting and analytics features have been super helpful for me in managing my projects. I can easily generate reports and create dashboards to track progress. I can export data to Excel, making it easier to work with outside Jira. The filters in Jira also make it simple to get exactly the data I need.

The tool has been really helpful for our remote team, especially with all our scrum events like daily stand-ups. Having Jira right there during those meetings helps us discuss tasks and settings easily. Plus, it integrates with Microsoft Teams, which we've found handy. It gives us a clear picture of what everyone's working on, so if there's a lack of progress on something, we can quickly address it through Slack or a call.”

“I like its ease of use. It doesn't require too much training. Even if I gave it to someone who hasn't gotten Jira experience, I feel like it's simple enough for them to figure it out.

It's not that complex, which is quite nice. And the fact that you can run reports quite easily. You know, the actual visual side is quite nice. You can tag people to it. I think all of that makes it a simple tool that's easy to interact and collaborate with.”

Shiv Chandra

“I like the Sprint board.

In Jira, the integrations I have used so far are the repository integration, like when it gets added, or the integration with Confluence, which is good. Both work great, Confluence as well as Bitbucket integration.

Jira's customization ability and workflows in boards is beneficial. We have already seen some workflow setups, so the flexibility and that feature is there. And we do ask for some custom page flow if needed. So, that's good.”

Saroj Ekka

“I like how easy it is to collaborate. We can add comments and tag specific people, which is useful for both onshore and offshore teams. Here, we can tag the person easily, and Jira updates. The commenting feature keeps everyone updated on what work has been done. Jira has a lot of versatility, which makes it a handy tool.

Within Jira, we can tag stories by the current sprint and associate them with the developer working on them. We also use Jira to track story points and progress based on status. Once a story is ready for QA, the QA team can create sub-tasks directly in Jira and start their work.

So, Jira is great for story management, but I'd like to see better tracking of employees' daily status for improved visibility for higher-level stakeholders.”

“I have experience with Jira's bulk tracking and issue management. We use it to add new features to our product, fix bugs, and address customer feedback.

The features I find most valuable for work and team productivity are creating subtasks and tracking their completion. Additionally, reporting features such as burnout charts and task reporting are quite valuable for us.

The tool's integration capabilities with other tools are quite nice. It's an open tool that easily integrates with third-party products like Microsoft Project and GitHub. Integrations work smoothly; we've also integrated it with requirement management tools per our needs.”

Hasan Hüseyin TEZCAN

Senior Project Manager & Project Technical Leader at C Tech Bilisim Teknolojileri San. ve Tic. A.S.

“The integration of other open source tools with Jira is very useful. It allows us to create documents and transcriptions, making it versatile beyond software development. Jira was originally developed for IT projects, but it can also be effectively utilized for non-IT sectors. It enables tracking and maintenance of projects outside the IT domain as well. I recommend the solution.

The reporting feature is very beneficial. Customers can report using the predefined report template.

The workflow is fine, but it's only integrated within Jira and not with other tools. Additionally, the SQL query is also very helpful.

The documentation on how to create dashboards and take advantage of other features in the tool are areas where the tool has certain shortcomings. The tool needs to have documentation on how to take advantage of different features in general.

In the future, I would like the tool to provide better integration with other tools. My company uses BMC Remedy. Integration of Jira with BMC Remedy, which is our company's ITSM tool or support tool, would be helpful. Better integration with other tools is required. I work in a large organization, where switching tools is not a rapid process owing to which getting data from one tool to another can be a cumbersome process.

“Sometimes the screens can be a bit too busy. There's often a lot of information on the screen. I think paring things down and applying some UX improvements might enhance the look and feel of the interface. But generally, it's fine for my use cases.

Perhaps some AI integration, like a co-pilot feature, could be a massive improvement. This is similar to how Microsoft introduced AI tools. That would be helpful, as I don't believe Jira has a great product in that space at the moment.”

“There are some features and reports we need that are not there. For example, if I have to find out the capacity of the current sprint by user and compare it with the previous sprint, that visibility isn't there. We can know the capacity and what happened with the whole sprint, but not for an individual person to see where it's falling and how it's tracking.

Report and analytics capabilities are important for a product manager. That visibility is important, so we use Jira. Some of the features are there, and I use my own Excels or other data things to compensate for that.”

“The communication features could be enhanced. While Jira sends email notifications when comments are added, it would be great to have a more **real-time chat function** directly within the Jira dashboard. This would streamline communication when we need to clarify defects.

Also, **test case management** could be more user-friendly. When we add or update test cases, there should be a better way to organize them within the dashboard.”

Room for improvement:

“Smartsheet is a cloud-based tool similar to Google Sheets in that multiple stakeholders can work on a document simultaneously. However, unlike Google Sheets, which saves changes in real time, Smartsheet requires users to manually save their changes. Only after saving will the changes be visible to other stakeholders. For example, if two or three people are working on a Smartsheet and one person makes changes, those changes will not be visible to the others until the person saves their work. This contrasts with Google Sheets, where changes are immediately visible to all users in real time.

If any changes are made in Smartsheet, they should be saved automatically and reflected to all stakeholders in real time. Currently, if I make even a small change to a cell, I need to save it manually. This adds a significant amount of effort, as I have to save every small change each time. Automatic saving, as seen in Google Sheets, would greatly enhance efficiency by ensuring all changes are visible to everyone immediately.”

I do not like the solution. From a project management and planning point of view, it's awful. The product must adopt some of the functionalities that are already in Microsoft Project. They must adopt functionalities like auto-scheduling, linking tasks together automatically, and scheduling based on the dependencies.

We have to manually put in every dependency in Smartsheet. It is incredibly annoying. In Microsoft Project, we just highlight the two that we want to link and click the link option, and it makes them dependent.

Wrike

Executive summary

Wrike is an online collaboration and project management software bringing together centralized task management and social collaboration features into one real-time workspace. It connects tasks, discussions, and emails to your actual project plan. You get an up-to-date picture of the project and can keep your team aligned with your strategy without boring status meetings. **Challenges Wrike helps solve:**

- Data silos: Tasks, discussions and documents scattered across email, Skype, personal computers and spreadsheets
- Poor visibility into work status
- Missed deadlines and project failures

Main benefits:

- Accelerating project delivery by using a platform your team will actually use and love
- Keeping all team members on the same page even across borders without lengthy status meetings, long email threads and spreadsheet updates
- Big picture of project progress with real-time updates and cross-project reports and newsfeed
- Real-time team collaboration with discussions, files attached to tasks, and a built-in document editor

Why Wrike?

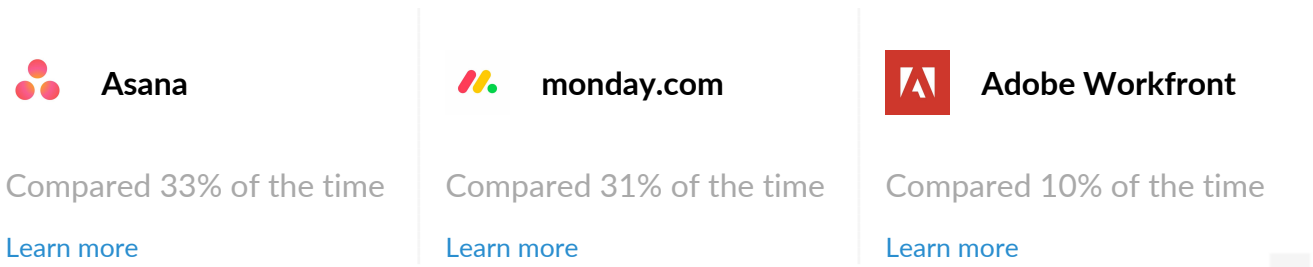

Wrike is a system your team will use. It helps them do their work, not just track it. Wrike can be easily customized to your needs as each team can set up their own workflow. Wrike scales as you grow, providing visibility and ease of use for teams of any size.

- User interface
- Alternative Dashboards
- Simple task and subtask creation and assignment
- My work view
- Security features
- Integration features
- Simple administration and account management
- Account types, which provide a good distribution of external and internal users licenses
- Individual workspaces

Pain Points

The main pain points mentioned:

- ✘ “What annoys me with Wrike and things that I would like to improve is that you need to have a very organized workflow that everyone in the company follows, and only then will Wrike work.”

Mladen Tubin

- ✘ “The product needs to send direct emails to customers updating the latest aspects since it is better to hear directly.”

Room for improvement:

“Sometimes, when you have a bigger project, item dependencies can take a while to update, other than that no complaints. “The solution, in general, works well. I haven’t found any bugs or anything to be improved.

Sometimes, since it's in the cloud, information isn't updated as fast as you need it to be. With some changes, it took a while to see those changes reflected.

It would be great if they could develop more reporting. In terms of the reporting model, if they can make it a little bit more complete, it would be ideal. We’d like to create reports using more filters and more fields. ”

“We feel that the actual project reports and roll-ups could be a lot different. We are seeking something more for the dashboard. We would like a high-level dashboard that can be broken down into individual product roll-ups and tasks that are assigned. If you assign someone to a task, it assigns them all of the tasks under that. We want to be able to break those down so that a person doesn't have an 800 task list, for example. We want more separation with that and a higher-level dashboard experience.”

“There's an acquisition unfolding with Broadcom and VMware. We're waiting to hear what this will mean for VxRail. Until that happens, it's hard to say what the roadmap will look like. There are a lot of changes happening due to the acquisition, even from a licensing perspective, and we're waiting to see. Therefore, it's tricky to evaluate anything.

The Dell PowerEdge Servers are very good servers. VMware is also a very good product. However, we don't get a full picture of VMware cloud formation as an orchestrated data center. Maybe, Broadcom and VMware could bundle their products together. It's possible they could offer the same experience as a public cloud over the data center. VxEail should offer its own cloud platform.

There can be a lack of functionality. There are limitations and restrictions of choice. There are only three modes of architecture. The hardware configuration is limited. Other vendors are more flexible.”

Broadcom Clarity

Executive summary

Clarity is the Project and Portfolio Management (PPM) solution created by Broadcom. The platform aims to help medium and large organizations to manage products and services. Clarity features scoreboards, financial analysis tools, and more.

The platform facilitates the delivery of projects and programs and can accelerate an organization's digital transformation. It allows users to create initiatives, add budgets and projects with a few clicks, and assign and track teams. It shortens the time to make changes to projects to minutes instead of days.

Broadcom Clarity PPM features in-app collaboration and timesheets accessible via mobile devices. Users can access the platform via desktop or mobile. The platform can be deployed on premises or as a cloud-based service with a hosted or SasS delivery.

How does it work?

Clarity's Strategic Portfolio Management enables planning and prioritizing of work to fit customer demands and business needs, managing the value stream from concept to cash.

Broadcom Clarity PPM Key Features

- **Strategic roadmaps:** Clarity's multidimensional road maps effectively eliminate organizational fatigue. It includes useful features such as drag-and-drop capabilities. It also allows you to map risks and dependencies and track project progress.
- **Project financials:** Clarity integrates with Power BI and Tableau with business intelligence solutions. The platform uses Microsoft Excel charting and grouping functions to keep a familiar feel to project and financial reports. You can customize your projects according to investment types and fiscal periods.
- **Collaboration features:** Broadcom Clarity PPM provides a central view of each employee's projects, schedule, and status. You can assign tasks to teams with pinning features without time-consuming filters.
- **Resource management:** Clarity enables you to filter available resources and investments to the department level. Doing this allows for managing labor and non-labor resources with ease.

Other features include:

One-click charts
Staffing and resource management
To-do boards
Investment hierarchies
Business widgets

Broadcom Clarity PPM Benefits

Quick setup: The platform is easy and fast to configure and deploy. It also includes migration services to help customers move to the cloud.

Lower cost: The SaaS version is a user-based subscription service that eliminates the need for infrastructure investment.

Constant updates: Updates are rolled automatically and included in the subscription to ensure the user always has the latest version.

Strong security: The Clarity infrastructure constantly updates identity-centric intrusion detection services. It features data protection capabilities on desktops and mobiles, including protection against distributed denial-of-service (DDoS).

Scalability: Its load-balanced environment enables users to scale up or down to match spikes in project-based activities. It also features pay-as-you-use.

Integrations: Integrates with financial apps, executive dashboards, HR software, ERP systems, etc.

Configurability: You can adapt Clarity PPM to your organization's requirements.

Reporting and business intelligence: Clarity's features include a built-in data warehouse and BI platform.

User-friendly: It features an intuitive user interface and interactive communication options.

Project management options: You can manage your project with Agile, classic, or hybrid methods inside Clarity PPM.

Broadcom Clarity PPM Use Cases

Organizations use Clarity PPM for a variety of use cases:

Time management
Product management
Resource management
Financial management
Project portfolio management
Reporting services

Project management

Ticket and change management

IT service desks

Financial services

Reviews from Real Users

"Broadcom Clarity PPM is a high-value product that helps users become productive. It's a very stable, scalable, and fast platform, even from a self management perspective," says Mohammad J., Senior Clarity PPM Technical Consultant at Al Rajhi Bank.

A Director of Operations at a tech services company adds that "It's very good out of the box, without configurations required."

Sergio C., Service Delivery Manager at Syntech, says, "The most valuable feature is the portfolio functionality because we have the ability to work with different scenarios and many kinds of financial management. We can integrate with ERP, and with other solutions from third-party vendors. The financial model in Broadcom Clarity PPM, it's the most valuable aspect."

“The dynamism of the application where you can modify it to fit your needs is valuable. For example, you can create fields, metrics, and measures on the fly. You don't have to be limited to what the out-of-the-box format would be. It allows you to generate fields, metrics, and reports off of that with relative ease.

The volume of information you can get out of a system is valuable. There is always a caveat when companies partially adopt something. So, resource capacity planning is an incredible value, but because we only partially use it, it is only partially valuable here. We don't fully put all the resource information in. ”

Lowell Wetzel

Systems Administrator at Cambia Health Solutions

[Read full review](#) 

“There was a need to keep better track of hours spent by employee type and how their times were allocated to given projects, or if not on a project, if it was just like a general administrative type kind of thing, how were we using our time. Of course, at the employee level, they would have their profiles. There were a variety of data fields that were made use of in order to identify the person by name, their skill sets, their charge-out rate, whether they were assigned full-time, or part-time, or not at all to a particular project or projects, plural. It was, of course, like a lot of things in life, it could be as simple or as complex as you want.

One of the things that we found out very quickly was when we went from kind of dabbling in program management and using Clarity, where management at the highest levels of our IT community, it was decided that this right here is our tool of choice. We're not going to be making use of any other tools. Everyone needs to make use of this project management. What they did is, they swung one way and then went to the other extreme. It was everybody who had to log their time. This was done at the highest level. Whether you were a contract employee, whether you were a full-time badged employee, whether you were part of supervisory, or management, or even a member of our senior leadership team, our executive management team, everyone had to account for their time.

There was tremendous pushback in doing this. The counterargument was, well,

there's a lot of companies, high tech, defense industry, et cetera, et cetera, they always do this. This is nothing new. If we're a "high-tech" company, we should follow suit and get on board with doing this. This is actually fairly common practice. Inside of the tool, there were performance metrics, things that could be tracked, graphed, and what have you. I began distributing to my internal customers at the management level where we were relative to other family groups if you will, or sub-organizations within the IT community. Where we were relative to entering our time sheets on a weekly basis on time.

We could follow what was the quality of the input, et cetera. There were probably about five or six metrics that we used. As a result, the groups that I supported were consistently ranked at the absolute top of the organization, as we were leveraging these built-in tools for tracking.

There were some groups that were laggards or not performing very well at all. It almost became some kind of internal competition. Whether it was program management, or just metrics and entering data, or keeping records up to date, because people would go out of the organization, there were tools that were inherent or built into Clarity that we leveraged.

I'm just an analyst at heart, I can take data from disparate systems. I can correlate them and provide management with what they need in order to make decisions and affect change in the organization or what have you. I did not have any issues with the system. The whole interface would fit on the inside of the screen of a laptop computer. I wouldn't say at 100%. Let's say the screen was brought down to like 80 or 90%, the entire interface would fit on the screen. At the top of being where the true interface was, where you were able to do your filter selections, things like that, that's where you were able to, an individual, depending on their access that they've been granted. I was actually given almost administrator access, where you could see all the options that you could drill down into.

I did create custom reports. Some people had great difficulty with that. To me, it was, what data fields do you need, and dragged them into the report that you want to create and save it. That, to me, was always a very simple thing. Some people have to be spoon-fed. Other people are naturally curious or inquisitive and will look at second-level, third-level options for a given application interface. That's what I did.”

We switched to the new UX at the end of March and it needs some time for the user to react to the new features. But if overall main features are being talked about, the financial part of Clarity is really appreciated. What needs improvement? Among things to be improved, Clarity can really work on its SAP interface. The current interface lacks out-of-the-box connectors for different applicators in the system. Therefore, this requires external support, which is beyond our expertise. In-house development is done for the interface, but as the system becomes complex, there is a building need to maintain the necessity of updates. If the updates aren’t maintained, then the system might be compatible. Additionally, the report generation process using a different software poses difficulties, leading to the need for external consultancy to create specific reports. Certain features, also face compatibility issues with our existing system. Mostly, the collaboration could be improved as well as a little bit on the data analytics part. This is based on feedback coming from the customers. I don't have any issues with the tool, but these are the use cases where clients will probably want to see some more advanced features, and the feedback has actually gone back to Broadcom also. We work closely with them, so I think they are aware of it. Broadcom is working on those features, but compared to other PPM tools, those are some of the areas that PCR can definitely be improved upon.

In the next release, I would like to have a little bit more functionality on chatbots in Clarity PPM, especially for support requests, such as for the most commonly used support tickets that people could resolve themselves. That's an area customers ask the most about. That's the common feedback, based on questions from them.

“One of the things that have always been a bit painful is the integration with reporting utilities. The current integration is with Jaspersoft, and there are a number of difficulties with that. If you're using out-of-the-box fields and everything, it is a bit slow and clunky. It has a drag-and-drop interface for the users. On the backend side, there is a report designer. They haven't given or allowed me any training on it yet. So, it has been a bit limited in its features. On one of the earlier report utilities, they had one called Actuate, which had VBA as its base programming language, and you could do quite dynamic things behind the scenes, whereas the Jaspersoft interface seems rather locked. So, you're limited in your options. Being a programmer, you like to have room to be able to invent and create rather than just being limited to a few selection boxes.”

“Whenever that second instance of Clarity came about, it was overwhelming even to people who were accustomed to working with program management tools. There were so many data fields that could potentially be leveraged, so many kinds of internal metrics. They actually brought in an outside consulting team.

I can't recall the name of the team, and where they were from. I remember they were from down South. They were actually on-premises for a week or so. Then, they came back periodically just to fine-tune things. I interacted with them on some occasions, as they wanted to pick my brain on how I was leveraging it to track applications and to run high level reporting for management on just basic metrics and also initially on just program management.

Overall, I found the tool to be fairly straightforward. That said, for people who did want to create their own reports, whatever instance we had, a lot of people found it difficult, and what they typically ended up doing is getting training.

They're very, very smart, certainly smarter than me, where they would come to me as a resource and say, "Hey, you seem to have a knack for this tool. Can you create a report that kind of sort of does this?" I would say, "Sure." Then, I would knock it out and they would say, "Great." Then, they would have a customized report that met their needs, where they could kind of fire at will and run the report whenever they wanted it to. However, many people didn't find it as easy as I did.

Many roles that I've had was the role of a financial analyst. There's been a number of sales organizations, sales organizations that I've supported over time. These are organizations that'll have anywhere from a couple hundred to as many as almost several thousand salespeople, the people who support them, et cetera. One of the organizations that I supported was the main sales force. These are like your rank and file sales representatives who go out and just sell equipment, that sells services, et cetera. It's everything from your entry-level sales reps, all the way to your highest-performing sales reps, all the supervisory management, and all the industry VPs and sales VPs, et cetera, right up to the highest levels of the sales organization for the United States. They had a variety of almost competing tools that were used to consolidate their prospects, and with their pipelines, et cetera. Salesforce had already been installed in Europe with great success.

There, you have, obviously, different languages, you have different management styles, organizational structures, et cetera, and yet they were able to install and

make use of, Salesforce quite successfully. They actually did it fairly quickly. For us, Europe included Eastern Europe, Russia, all of North Africa, and the Middle East - they all installed Salesforce and did so fairly quickly and successfully. However, there was great resistance in North America. The primary reason was that Salesforce was a cloud-based technology. There was tremendous resistance in both the Canadian and the US communities to have anything other than something that was internal inside of our firewall.

The Salesforce people were saying, "We work with governments. We work with everything from defense contractors, to military organizations, to intelligence organizations. There's nothing to fear. This is the future." Yet there was tremendous resistance. It wasn't until someone at the highest levels of the corporation said, "We've got Europe covered. We got developing markets covered. North America, get together and get on board with Salesforce. That way, we have unified technology worldwide." Meanwhile, I was actually taking these two competing systems, where the sales reps focused on equipment and then secondarily services, as opposed to another sales organization that would focus on services and then would periodically think about selling equipment.

There were competing philosophies and their prospects resided in two different systems. What I would do is developed a knack for taking these two data sets, exporting them out of the two systems, smashing them together, removing the overlapping or duplicate records, then being able to present to management, "You have anywhere between an \$8 to \$9 billion pipeline for the next nine months. Assuming that you close 20% to 25% of your deals, this is what this might be. You're in striking distance of achieving these types kinds of services, signings, or equipment signings." Management got really, really excited about this. Then, what I did after that was that became the basis, the underlying data, that smashed together data, became the data that we ultimately fed into Salesforce.

The reason why I'm giving this background is one of the things that Salesforce did that was very, very clever, is allowed just four people to take data and create a shell. What they did is they said, when they were doing the introduction to our team, they said, "There are literally hundreds and hundreds and hundreds of data fields that are used by our clients all over the globe, but what we're going to do, based upon the data set that you have in the present, we're only going to create

this shell or this instance of Salesforce, and we're only going to use 75 data fields." That, to me, was very, very powerful. Even if they were data fields that were using different nomenclature, it was considered a standard naming convention that Salesforce was familiar with. As time went by, we began expanding, making use of a greater and greater quantity of data fields, and being able to slice and dice, if you will, data in greater levels of detail and complexity. It was easier for rank and file, whether you were finance, or information technology people, or salespeople, sales reps, management, whatever, everybody was able to get their heads around a tool that was becoming more and more sophisticated as the months went by as opposed to starting off with saying, "There are 300 possible data fields, and metrics, and calculations, or whatever, but we're only going to use 35 of them, or 50 of them, or whatever." The fact that everybody can see them is very, very intimidating. That was one of the reasons for the pushback in our organization when Clarity was rolled out. People could see all these data fields. Either the implementation wasn't good or the consultants that we were dealing with weren't very thoughtful. However, when people saw all the possible data fields that they had, it was overwhelming.

That was consistent feedback that I heard through a variety of channels and there was resistance due to that. If there's any feedback that I would give is that it's one thing to say, "Here are all the possibilities." However, then, when the salespeople marry up with the folks who are going to do the implementation, they need to be able to say, "So what are your immediate needs? Maybe we'll throw some additional data fields in there to kind of spice things up." Then, as time goes by, reveal additional data entry options, either for people who are making the actual entries or what have you. That's something that I observed firsthand.

I have seen interfaces that are much hipper, and much more intuitive. The layouts might have a more modern or current touch and feel. With the instance that we had, it seemed like it was just a little outdated. When you were clicking on hypertext links, as opposed to a button. Now, these are nuanced differences, however, having a menu where you'd see a header, underneath the header, you would see a blue font that was a hypertext link. Then, depending on whether you wanted to look at application data, whether you wanted to enter your time, or you wanted to look up specific projects and dig into those projects, into the sub-elements that make up all the different views within a given project, or you wanted

to get to a data export function, or whatever, it was all a function of finding your overall category and then find underneath that the appropriate link.

I don't know how old that interface was. Maybe it's still like that now, or a bit more modern, however, from my experience, a more modern interface would be a bonus. ”

Pricing

“The subscription is not that expensive.”

“In recent times, I have been involved in the purchase of the license for this solution. However, the process of procurement changed and the option to buy individual licenses was no more available. The new subscription model was introduced, as a followed-up trend in the industry. The subscription costs put us in shock because it was double what we paid in the past as the yearly maintenance. We negotiated and the price was dropped. But this incident made me observe a lack of transparency from Broadcom in terms of licensing expenses. This isn't unique to Broadcom but seems to be a broader industry issue.”

“The price of Broadcom Clarity PPM is reasonable. My customers pay a license to use this solution on an annual basis.”

“The licensing costs are a little bit high, and unfortunately, it has been a while since I've had that paperwork in front of me. I don't remember how much it was, but it seemed like it was fairly high. It is probably comparable to some of the other solutions because I do know that, for example, on a lot of the AWS stuff, they found that the costs wound up being higher than having some on-prem solution. Comparatively, Clarity is within the price range of other solutions.”
